Characterization of a Carbon Fiber Sheet Molding Compound for

Compression Molding Simulation Yining Jiang, 2021 Carbon fiber reinforced sheet molding compound CF SMC is a ready to mold prepreg material made from chopped carbon fibers combined with a thermosetting resin system Compression molding of CF SMCs is a promising process to deliver lightweight and high volume composite parts for the automotive industry A few technical aspects complicate the production of high quality SMC parts by compression molding Defining a robust and optimized processing method for a new part geometry and a given CF SMC material can be challenging since the thermosetting resin system of CF SMC is depending nonlinearly on molding temperature pressure and cavity closing rate The selection of an appropriate set of process parameters is not intuitive Nowadays process design to manufacture SMC parts with the required features are still relying on costly and labor intensive trial and error molding practices Therefore virtual manufacturing of SMC parts through physics based simulations is favored since it has the potential to replace the traditional trial and error approach shorten the early process development stage and mitigate the associated technical risks Proper material characterization and modeling of CF SMC prepreg system are the fundamental building blocks of accurate and realistic compression molding process simulations This thesis first presents an integrated material characterization roadmap for a CF SMC prepreg and its corresponding thermosetting resin system The carbon fibers used in this CF SMC are about 25mm long The main chemical species of this resin system are vinyl ester primary backbone styrene reactive diluent and isocyanate thickening agent Thermokinetics behavior of the neat resin is studied and characterized using differential scanning calorimetry DSC Q2000 from TA Instruments through temperature scanning and isothermal experiments A cure kinetics model is developed using Advanced Kinetics and Technology Solutions Thermokinetics AKTS TK software Relative viscosity evolution and gel time of the neat resin and the CF SMC prepreg are measured using a rheometer MCR302 from Anton Paar with parallel plate configuration under isothermal and dynamic testing conditions Gelation models for both systems the neat resin and the CF SMC prepreg are proposed A flow compaction testing fixture is developed to study the CF SMC prepreg flow under several testing conditions namely at different temperatures and mold closure rates The test fixture is mounted on an MTS Landmark servohydraulic testing system Compression load is acquired by the MTS 100kN load cell and TestSuite TW Elite software The length width and thickness of each SMC prepreg specimen before and after its compression trials are measured to obtain the corresponding strain Correlations with these sample attributes are studied to better understand the material flow characteristics during compression molding Then the material models developed in this work are implemented into a commercial software package Autodesk Moldflow through Solver Application Programming Interface API A simulation of CF SMC compression molding process is developed using Moldflow software The experimental data obtained from flow compaction testing trials is ultimately used to validate the simulation
