Tests on a Tangye Vcp1 Engine** D. W. Tryhorn,BRITISH INTERNAL COMBUSTION ENGINE RESEARCH ASSOCIATION LTD SLOUGH (England),1963 A Tangye VCP1 engine was tested under high pressure variable temperature charge conditions using both early and late inlet valve closing points to reduce the effective compression ratio It was thus possible to obtain performance data over a range of compression temperatures lower than is feasible with a normal cycle The results serve to show the effect of compression temperature on an engine with a high swirl single hole nozzle combustion system The theoretical gains expected from use of the modified Atkinson cycle were however not substantiated by the results This was traced to the excessive values of the charge heating effects associated with the throttling losses which inevitably result from closing the inlet valve while the piston is in mid stroke The consequence was that the compression temperature was never low enough to have a really marked effect on combustion but at the lowest temperature reached there was some deterioration in performance attributable to an over cool charge Author      *Systems Operation, Testing and Adjusting* Caterpillar Inc.Peoria, Ill.,1990
