

Chapter 21: Electrostatics
Electric Potential

Just as PE transforms to KE for a mass lifted against the gravitation field (left), the electric PE of an electric charge transforms to other forms of energy when it changes location in an electric field (right). In both cases, how does the KE acquired compare to the decrease in PE?

Complete the statements.

A force compresses the spring. The work done in compression is the product of the average force and the distance moved. $W = Fd$. This work increases the PE of the spring.

Similarly, a force pushes the charge (call it a test charge) closer to the charged sphere. The work done in moving the test charge is the product of the average _____ and the _____ moved. $W = \underline{\hspace{2cm}}$. This work _____ the PE of the test charge.

If the test charge is released, it will be repelled and fly past the starting point. Its gain in KE at this point is _____ to its decrease in PE.

At any point, a greater amount of test charge means a greater amount of PE. But not a greater amount of PE *per amount of charge*. The quantities PE (measured in joules) and PE/charge (measured in volts) are different concepts.

By definition: **Electric Potential = PE/charge**. 1 volt = 1 joule/1 coulomb. So 1 C of charge with a PE of 1 J has an electric potential of 1 V. And 2 C of charge with a PE of 2 J has an electric potential of _____ V.

If a conductor connected to the terminal of a battery has an electric potential of 12 V, then each coulomb of charge on the conductor has a PE of _____ J.

You do very little work in rubbing a balloon on your hair to charge it. The PE of several thousand billion electrons (about one-millionth coulomb [10^{-6} C]) transferred may be a thousandth of a joule [10^{-3} J]. Impressively, however, the electric potential of the balloon is about _____ V!

Why is contact with a balloon charged to thousands of volts not as dangerous as contact with household 110 V?

The Mangle of Practice Andrew Pickering, 2010-12-15 This ambitious book by one of the most original and provocative thinkers in science studies offers a sophisticated new understanding of the nature of scientific mathematical and engineering practice and the production of scientific knowledge Andrew Pickering offers a new approach to the unpredictable nature of change in science taking into account the extraordinary number of factors social technological conceptual and natural that interact to affect the creation of scientific knowledge In his view machines instruments facts theories conceptual and mathematical structures disciplined practices and human beings are in constantly shifting relationships with one another mangled together in unforeseeable ways that are shaped by the contingencies of culture time and place Situating material as well as human agency in their larger cultural context Pickering uses case studies to show how this picture of the open changeable nature of science advances a richer understanding of scientific work both past and present Pickering examines in detail the building of the bubble chamber in particle physics the search for the quark the construction of the quaternion system in mathematics and the introduction of computer controlled machine tools in industry He uses these examples to address the most basic elements of scientific practice the development of experimental apparatus the production of facts the development of theory and the interrelation of machines and social organization
