1.1.1 DNA STRUCTURE

1. DNA is deoxyribonucleic acid, abbreviated DNA.

- 1. Deoxyribonucleotides, which make up DNA
 - phosphate group
 - deoxyribose sugar (D-ribose sugar)
 - and a nitrogenous base

2. BASES

- 1. purines (Adenine & Guanine) through adenine (A) and guanine (G)
- 2. pyrimidines (Thymine & Cytosine) through thymine (T) and cytosine (C)

3. Double-strand model that is foundation of understanding phylogenetic and target molecules (basis of testing)

- 1. Two short strands held apart by hydrogen bonds in double helix
 - purines + pyrimidines form hydrogen bonds in complementary bases pairing (A-T, G-C)
 - strands separate and separate into opposite directions

Berg, John L. Tymoczko, Lubert Stryer, 2011-06-01 Since its first edition in 1975 this extraordinary textbook has helped shape the way biochemistry is taught offering exceptionally clear writing innovative graphics coverage of the latest research techniques and advances and a signature emphasis on physiological and medical relevance Those defining features are at the heart of this edition **Biological Systems** Shelby Delos Gerking, 1974 *Genes Five* Benjamin Lewin, 1994 Cells as macromolecular assemblies DNA as a store of information Translation expressing genes as proteins Constructing the

cell Control of prokaryotic gene expression Perpetuation of DNA Organization of the eukaryotic genome Eukaryotic transcription and RNA processing The dynamic genome DNA in flux Genes in development **Genes** Benjamin Lewin,1987

This book is intended to provide a coherent view of genetics from the perspective of the gene By bringing together in a concise format the enormous mass of information that has accumulated it is possible to address the crucial questions what is a gene how is it reproduced how is it expressed what controls its expression The book starts by considering the biochemical basis for heredity as seen through the structure of DNA Within its main body the discussion of transcription and its regulation have been integrated into a single section More can be said about processing of RNA in eukaryotes we are gaining a much keener impression of the flux of DNA in the genetic material manipulation of DNA in the genome is acquiring more power and a new final section takes the topics under discussion into the further realm of normal development during embryogenesis and abnormal development of cancer cells **Genetics** Geoffrey L. Zubay,1987 **Biology: How Life Works (Volume 1)** James Morris,2013-01-04 Ordinarily textbooks are developed by first writing chapters then making decisions about art and images and finally once the book is complete assembling a test bank and ancillary media This process dramatically limits the integration across resources and reduces art media and assessments to ancillary material rather than essential resources for student learning Biology How Life Works is the first project to develop three pillars the text the visual program and the assessment at the same time All three pillars were developed in parallel to make sure that each idea is addressed in the most appropriate medium and to ensure authentic integration These three pillars are all tied to the same set of core concepts share a common language and use the same visual palette In this way the text visual program and assessments are integral parts of student learning rather than just accessories to the text *Essential Biology* Neil A. Campbell,Jane B. Reece,Eric Jeffrey Simon,2007 *Essential Biology* is a brief non majors biology book that combines clear writing real world applications vivid art and powerful media to teach readers the important concepts of biology and give them an appreciation for how biology relates to their everyday lives In the Second Edition best selling authors Neil Campbell and Jane Reece are joined by Eric Simon who uses his experience teaching non majors biology to keep the book both accessible and up to date To help readers become informed citizens the new edition features even more human applications and up to date information on important issues like DNA technology cloning and global warming KEY TOPICS The book covers four major biological topics cells genetics evolution diversity and ecology and uses evolution as an overarching theme to tie all 20 chapters together For college instructors students or anyone interested in biology McGraw-Hill's MCAT, Second Edition George J.
