

Chapter 5 Functions in PHP

Functions are sections of code that are defined by the user to perform a specific task. Functions can take values called **arguments** as input, perform some operations, and then may return another value. The function transfers any argument values into new variables, called **parameters**, which can then be used within the function. A function will be executed by a call to the function.

Defining and Calling Functions

A user defined function declaration starts with the word "function":

Syntax

```
function functionName ( ) {  
    code to be executed;  
}
```

A function name can start with a letter or underscore (not a number). Give the function a name that reflects what it does. Remember that function names are NOT case-sensitive.

To define a function, you have to give it a name. To do this, you use the keyword function, followed by the function name. Any parameter names are listed in parentheses after the function name. The code that forms the body of the function is placed in braces after the parameters.

Example 4.1

```
<?php  
function writeMsg ( ) {  
    echo "Hello world!";  
}  
writeMsg ( ); // call the function  
?>
```
