PROBABILITY

The word PROBABILITY is used, in a general sense, to indicate a vague possibility that something might happen. It is also used synonymously with chance.

Random Experiment

If the result of an experiment conducted any number of times under essentially identical conditions, is not certain but is any one of the several possible outcomes, the experiment is called a trial or a random experiment. Each of the outcomes is known as an event.

Examples:

1. Drawing 3 cards from a well shuffled pack is a random experiment while getting an Ace or a King are events.
2. Throwing a fair die is a random experiment while getting the score as '2' or an odd number are events.

Mutually Exclusive Events: If the happening of any one of the events in a trial excludes or prevents the happening of all others, then such events are said to be mutually exclusive.

Example: The events of getting a head and that of getting a tail when a fair coin is tossed are mutually exclusive.

Equally Likely Events: Two events are said to be equally likely when chance of occurrence of one event is equal to that of the other.

Example: When a die is thrown, any number from 1 to 6 may be got. In this trial, getting any one of these events are equally likely.

Independent Events: Two events E_1 and E_2 are said to be independent, if the occurrence of the event E_2 is not affected by the occurrence or non-occurrence of the event E_1 .

Example: Two drawings of one ball each time are made from a bag containing balls.

Here, we have two events drawing a ball first time (E_1) and drawing a ball second time (E_2). If the ball of the first draw is replaced in the bag before the second draw is made, then the outcome of E_2 does not depend on the outcome of E_1 . In this case E_1 and E_2 are Independent events.

If the ball of the first draw is not replaced in the bag before the second draw is made, then the outcome of E_2 depends on the outcome of E_1 . In this case, events E_1 and E_2 are Dependent events.

Compound Events: When two or more events are in relation with each other, they are known as compound events.

Example: When a die is thrown two times, the event of getting 3 in the first throw and 5 in the second throw is a compound event.

Definition of Probability

If an event E can happen in m ways and fail in k ways out of a total of n ways and each of them is equally likely, then the probability of happening E is $\frac{m}{(m+k)} = \frac{m}{n}$ where $n = (m+k)$.

In other words, if a random experiment is conducted n times and m of them are favourable to event E , then the

Statistics of Earth Science Data Graham J. Borradaile, 2013-11-11 The Goals of Data Collection and Its Statistical Treatment in the Earth Sciences The earth sciences are characterised by loose and complex relationships between variables and the necessity to understand the geographical distribution of observations as well as their frequency distribution Our frequency distributions and the looseness of relationships reflect the complexity and intrinsic natural variation in nature more than measurement error Furthermore earth scientists cannot design experiments according to statistical recommendation

because the availability and complexity of data are beyond our control Usually the system we are studying cannot be isolated into discrete independent variables These factors influence the first steps of research how and where to collect specimens or observations Some issues are particularly troublesome and common in earth science but are rarely handled in an undergraduate statistics course These include spatial sampling methods orientation data regionalised variables time series identification of cyclicity and pattern discrimination multivariate systems lurking variables and constant sum data It is remarkable that most earth science students confront these issues without formal training or focused consideration
