

## Chapter 6 Review Questions

1. While playing basketball, nine-year-old Marcus fell and broke his left arm. The arm was placed in a cast and appeared to heal normally. As an adult, Marcus was puzzled because it seemed that his right arm is longer than his left arm. He measured both arms and he was correct—his right arm is longer! How would you explain to Marcus what happened?

Marcus broke his epiphyseal plate, which is the area of growth. The damage slowed the growth of his left arm's bone.

2. Astronauts in space exercise as part of their daily routine, yet they still have problems with bone weakness after prolonged stays in space. Why does this happen?

Astronauts in space have no gravity pushing down on them, therefore their bones aren't holding their weight anymore. This causes the bones to weaken cause they aren't feeling the pressure from gravity anymore.

### Bone Growth & Remodeling

3. Explain the difference between appositional and interstitial growth. Which occurs at the epiphyseal plate? Which occurs at the periosteum?

Interstitial growth - growth in length; epiphyseal plate  
Appositional growth - growth in thickness; periosteum

4. What is bone remodeling, and why does it occur?

Bone remodeling is the resorption (removal of minerals + collagen fibers by osteoclasts) and deposition (addition of minerals and collagen fibers by osteoblasts). It's a continuous process to maintain a balance must exist between the actions of osteoclasts and osteoblasts.

Describe the four zones of the epiphyseal plate, and the function of each:

- a. *Zone of Resting Cartilage* - Chondrocytes anchor epiphyseal plate to epiphysis
- b. *Zone of Proliferating Cartilage* - Chondrocyte divide and grow and replace those by the diaphysis → rapidly dividing
- c. *Zone of Hypertrophic Cartilage* - Chondrocytes grow and mature → increasing in size
- d. *Zone of Calcified Cartilage* - Chondrocytes die, osteoblasts invade → build bone → secrete extracellular matrix
