Abstract

Decision trees are a powerful machine learning algorithm for classification and regression tasks. They are a type of supervised learning algorithm that can be used for both classification and regression tasks. The tree structure represents the decision-making process, with internal nodes representing features and leaf nodes representing the final classification or regression output. The tree is built by recursively splitting the data into subsets based on the values of the features. The most common splitting criterion is the Gini index, which measures the impurity of the data. Other splitting criteria include entropy and information gain. The tree is trained by finding the optimal split at each node, which can be done using a greedy algorithm or a more sophisticated optimization technique. The resulting tree can be used to make predictions on new data.

Keywords

Decision trees, supervised learning, machine learning, classification, regression, Gini index, entropy, information gain, feature selection, model evaluation.

9.1. Introduction

A decision tree is a flowchart-like structure that represents a classification or regression problem. The tree is built by recursively splitting the data into subsets based on the values of the features. The most common splitting criterion is the Gini index, which measures the impurity of the data. Other splitting criteria include entropy and information gain. The tree is trained by finding the optimal split at each node, which can be done using a greedy algorithm or a more sophisticated optimization technique. The resulting tree can be used to make predictions on new data.
